

Course Registration System

(Spring Boot + Java Full Stack)

The Course Registration System is a full-stack web application developed using **Spring Boot**, **Java**, **REST APIs**, and **MySQL** to manage student course enrolments efficiently. The system enables students to register, view available courses, enrol in subjects, update their details, and drop courses through simple **CRUD** operations. Administrators can **add**, **modify**, and **delete** course information while maintaining structured academic records.

The application follows a layered architecture with controller, service, and repository components, ensuring scalability and maintainability. It uses **JPA** and **Hibernate** for database interaction and provides a user-friendly frontend interface for seamless interaction. This project demonstrates real-world implementation of full-stack development concepts such as **RESTful** services, database management, and authentication-ready design, making it suitable for academic use.
